| **SEXUAL GROWTH AND BODY IMAGE** | 1) Reflect on the advantages of having a positive body image  
- Role of the body in sexual expression  
- Feelings about your own body as a girl or boy  
- Attitudes and behaviours related to appreciating your own body  
- Advantages of having a positive body image | 2) Understand how certain norms can influence body image  
- Situations that convey standards and messages from your family and other people in your life, including peers  
- Situations that convey standards, messages or criteria in society and the media  
  - Representations of the female body  
  - Representations of the male body  
- Influence of these representations on the body image of men and women | | | |
| **WHY DO STUDENTS** | Puberty destabilizes body image to some extent during a period when adolescents are preoccupied with what they wish to project (fashion, peer affiliation, attitudes).³ | ³ Adjustment to pubertal changes occurs differently in individual young people and depends on various factors: | | | |

Relevant to:  
- Fighting homophobia  
- Promoting egalitarian relationships  
- Preventing sexual assault  
- Preventing violence  
- Promoting a healthy body image  
- Respecting sexual diversity  
- Being aware of the sexualization of public space

Ministère de l’Éducation, de l’Enseignement supérieur et de la Recherche
NEED TO LEARN THIS?

- Adolescents who go through gradual changes at a rate parallel to that of their peers are more likely to adapt to these changes better than adolescents who go through rapid changes that do not parallel those of their peers.²
- Peer pressure (conversations about appearance, comparisons), media and other social pressures can create dissatisfaction with one’s own body.³
- As adolescents mature over time, they are more capable of bringing their beliefs into harmony with those of the significant people around them.⁴

A negative body image is associated with feelings of depression, eating disorders and low self-esteem, especially among adolescent girls.⁵

The approach taken in Secondary Cycle One should:
- take into account the later onset of puberty in some young people: age 13 for girls and age 14 for boys.⁶
- support adolescents in developing a positive body image.
### LEARNING CONTENT

1) Recognize the role of puberty in consolidating your sexual identity as a boy or girl
   - Events at the beginning of adolescence
     - Physical and psychological transformations of puberty
     - Relations with peers of the same or opposite sex, romantic awakening and dating
   - Exploration of new sexual values and norms beyond those of the family
     - Peers, social and media environments
     - Stereotypes regarding girls and boys
   - Identity
     - The girl or boy that you are, that you want to be

2) Explain how representations of sexuality in the public space influence your own representations, attitudes and behaviours in the area of sexuality
   - Norms and values conveyed in the public space
   - Norms and values conveyed by the people around you
   - Personal norms and values
   - Expressing your sexuality
     - Public space (expressing your femininity or masculinity, contact with someone you like, romantic relationship, etc.)

### IDENTIFY, ROLES, GENDER STEREOTYPES AND SOCIAL-NORMS

- **SECONDARY I**
  - (12-13 years old)
  - Relevant to: 🔄 Fighting homophobia 🛑 Promoting egalitarian relationships 🕵 Preventing sexual assault 🗿 Preventing violence 🤗 Promoting a healthy body image 🌐 Respecting sexual diversity 🚶 Being aware of the sexualization of public space 📱 Preventing STBBIs

- **SECONDARY II**

<tr>
<th>Why do students need to learn this?</th>
<th>Adolescents between 14 and 17 years of age:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Young adolescents (12- to 14-year-old girls; 13- to 15-year-old boys):</td>
<td>are especially preoccupied with what others think about them, but they are returning to a more flexible view of gender roles.</td>
</tr>
<tr>
<td>• can be flexible in adopting non-stereotypical gender roles, but after the onset of puberty they are confronted with growing pressures to conform to more traditional behaviours and attitudes.</td>
<td>• may feel embarrassed or anxious about what behaviours to adopt, but they are able to evaluate more dimensions of a situation and make decisions about their behaviours, attitudes and beliefs with greater independence.</td>
</tr>
<tr>
<td>• make decisions partly influenced by the desire to conform to expectations related to their gender and to boy-girl interactions, especially to avoid rejection by their peers.</td>
<td>• need consistency and are faced with the challenge of constructing their own identity, a task that can be even more challenging for young people from different cultural communities.</td>
</tr>
<tr>
<td>• who do not conform to gender stereotypes or who are homosexual are subjected to more physical and verbal violence than young heterosexuals.</td>
<td>• move toward a more realistic perception of their aspirations at the end of their secondary studies (reducing the distance between the ideal self and the real self).</td>
</tr>
</tbody>
</table>

The approach taken with adolescents in Secondary Cycle One should:

- continue to support the development of their self-awareness in order to increase their ability to make decisions based on their desires and needs. It should also take into account the positive and negative influence exerted by certain prevalent norms in society and in the peer group regarding the expression of sexuality.

Adolescents between 14 and 17 years of age:

**WHY DO STUDENTS NEED TO LEARN THIS?**

All adolescents are faced with emotions and romantic relationships, but among young people of the same age, each individual’s experience is different.87

Romantic relationships contribute positively to adolescents’ development.33 Through these relationships, they gain valuable experience in this period of their lives.32 Regardless of the adolescents’ gender, sexual orientation or culture, such relationships provide a learning context in which young people can progressively construct their identity as a romantic partner33 and this will be useful to them in future intimate relationships.34 Reciprocity, characterized by mutual support and shared trust,35 is a central feature of romantic relationships.36

The gradual path to intimacy37 is marked by a desire for closeness, an exchange of confidences, and opening up about oneself. Entering into a romantic relationship calls for new skills that are nevertheless an extension of previous experiences in relationships with family and with peers of the same sex.38 The intensity of romantic feelings and the awakening of sexuality distinguish adolescent experience from that of childhood.39 Many adolescents who have no romantic partner participate in outings and activities with young people of the opposite sex to whom they may sometimes be attracted. These activities are often a prelude to the development of a romantic relationship40 as they help them meet potential romantic partners.41 The need for security, self-fulfillment and recognition are some of the developmental needs that are satisfied by adolescent romantic relationships.22

---

Relevant to:  🔸 Fighting homophobia 🔷 Promoting egalitarian relationships 🔗 Preventing sexual assault ☎️ Preventing violence ☂️ Promoting a healthy body image ✡️ Respecting sexual diversity 🌍 Being aware of the sexualization of public space ⚒ Preventing STBBIs

MINISTÈRE DE L’ÉDUCATION, DE L’ENSEIGNEMENT SUPÉRIEUR ET DE LA RECHERCHE 7
Adolescent romantic relationships are influenced by:

- the peer group that dictates romantic norms.
- the family that acts as a model for close relationships and regulates the speed at which young people engage in romantic relationships.
- the social and cultural norms that convey beliefs about the value of love; the appropriate times for forming romantic relationships; and male and female gender roles in such relationships. Social and cultural norms also encourage or inhibit romantic and sexual involvement by defining which romantic and sexual partners are appropriate.
- representations of adolescent romantic relationships constructed from their own romantic experiences and from the observation of relationships in their environment (e.g. parents, siblings, peers, the media) that shape their romantic behaviours and form the basis of their interpretation of the behaviour of others. Young people’s representations of romantic relationships are also influenced by social and cultural norms that dictate the nature of and appropriate time for these relationships, as well as the characteristics that make people more attractive or less attractive.

Young people between 11 and 13 years of age are intensely interested in topics related to love and report that they have already been in love. Between 20% and 40% of young people between the ages of 11 and 15 say that they have a boyfriend or girlfriend.

Romantic relationships at the beginning of adolescence are complementary to young people’s friendships with the same sex because they often form within a group of friends who serve to bring them together.

Adolescents between 12 and 15 years of age:

- have expectations about their romantic relationships that mainly involve doing things they enjoy together.
- may have several short-term romantic relationships in the same year and go through the same number of breakup.
- experience non-reciprocal feelings more often, mainly because they have mistaken friendship with a peer for romantic interest; feel confused about a friendship that includes flirting and physical contact with someone of the opposite sex; want to have a romantic relationship with a peer who does not share their feelings.
- are preoccupied with their peers’ acceptance of their romantic partner and are more influenced by stereotyped representations of romantic relationships in the media, given their less developed self-awareness.
- who are wondering about their sexual orientation and who are attracted to members of their own sex are faced with more challenges in identifying and meeting a potential partner and often go out with partners of the opposite sex. These relationships may provide a facade of heterosexuality and help them to become aware of their homosexual emotional and sexual attractiveness. These young people, especially boys, are at greater risk of being victimized or harassed by their peers because of the social non-acceptance of homosexual attraction and behaviours.

The approach taken with 12- to 15-year-olds should:

- develop a realistic vision of romantic relationships (expectations and beliefs about attachment, caring for someone, sexuality and affiliation).

Adolescents may experience violence in their dating relationships. The prevention of all types of violence in dating relationships is necessary, especially since:

- more than one-third of young people in Secondary III and V who were in a dating relationship experienced at least one type of violence (verbal, psychological, physical or sexual).
- 60% to 80% of relationships continue in spite of episodes of violence. Love or the hope to change the partner are among the explanatory factors.
- young people who have experienced violence in a relationship are more at risk of experiencing it in future relationships.

Prevention at this age should:

- help students to recognize the types of violence and their implications.

Between 60% and 80% of adolescents 16 years of age or older report that they are in a romantic relationship. Young people at this age:

- are more likely to engage in a committees relationship and to share emotional intimacy and take care of one another.
- place more value on a romantic partner on the basis of mutual feelings and less on the basis of physical appearance and personality.
- place emphasis on long-term aspects of a relationship and are able to define commitment in a relationship based on affective aspects (feelings) and cognitive aspects (intimacy).
- who are entering into a romantic relationship for the first time are more likely to experience fluctuations of emotion and behaviour because they cannot rely on previous experience and a peer group to judge what is acceptable in a relationship.

The approach taken with adolescents at the end of secondary school should:

Relevant to: Fighting homophobia, Promoting egalitarian relationships, Preventing sexual assault, Preventing sexual assault, Preventing violence, Promoting a healthy body image, Respecting sexual diversity, Being aware of the sexualization of public space, Preventing STBBIs
· support them in their reflections about the new feelings they are experiencing in relation to love and romantic relationships and teach them to manage positive and negative feelings (non-mutual attraction, rejection, breaking up, first betrayals, heartbreak).

· help them develop their ability to manage in a healthy way the difficulties and conflicts that arise in a romantic relationship since this can foster the autonomy of both partners in the relationship.

manifestations (e.g. control) and warning signs.

· form part of a broader reflection on love since certain unrealistic representations can contribute to violence (as inflicted by the perpetrator or suffered by the victim).

· take into account the positive role of peers, since young people who experience violence often have difficulty recognizing it (help, witness, confidant), as well as the negative influence they can have by encouraging violence.

· sensitize students to the advantages of engaging in romantic relationships that are consistent with the goals they are pursuing in other areas of their lives in order to achieve overall personal satisfaction.
### SEXUAL ACTIVITY

#### LEARNING CONTENT

1) Discuss the characteristics of sexual activity in adolescence and the motivations behind it
   - Sexual desire and physiological manifestations of sexual arousal
   - Role of emotional commitment
     * First sexual contact is often experienced with a romantic partner
   - Exploratory and progressive nature of sexual activity
     * Sequence of sexual behaviours, from exploratory activities (kissing, touching) to genital sexual relations
   - Norms of adolescent sexual activity
     * Myths of the precocious nature of adolescent sexual behaviour conveyed by the peer group and the media
     * Contradictory nature of certain norms (e.g. the importance of respect for sexual diversity alongside homophobic images and messages in the social environment)

2) Recognize what can inform your choices concerning sexual activity in adolescence
   - Knowing yourself
     * Your attitudes toward sexual

1) Reflect on the place of desire and pleasure in sexual activity
   - Questions and concerns regarding sexual behaviours
     * E.g. what constitutes sexual relations, normality, feelings of obligation
   - Place of desire and romantic and sexual fantasies
   - Place of pleasure
     * Psychological pleasure of sex (e.g. positive feelings that go with sexual behaviours: shared feeling of closeness, intimacy, feelings of well-being)
     * Physical sexual pleasure (e.g. sexual response: desire, excitation, orgasm, relaxation)

2) Become aware of the factors that can influence sexual relations in adolescence
   - Context
     * Romantic involvement or non-romantic relationship (casual sex, friendship with benefits, one-night stand)
     * Planned or spontaneous, protected or unprotected relations
   - Relational dynamics
     * Intimacy (interdependence or control)

1) Understand your position on different issues related to sexual relations in adolescence
   - New socio-sexual realities
     * E.g. friends with benefits, sexting, sexualization of public space, etc.
   - Alcohol and drug consumption
   - Slander of reputation
     * E.g. double standards: girls and boys who engage in sexual relations are not judged the same way, etc.
   - Consent
   - Divergences between the expectations and motivations of partners
   - Dealing with social pressures and norms, etc. (from partner, peers, parents, media—including pornography and reality TV)
     * Performance anxiety (being competent, thrill-seeking)

2) Become aware of factors important to sustaining emotional intimacy and sexual intimacy
   - Emotional intimacy between partners
     * being open about yourself, communicating, trusting the other person

Relevant to: ツ Fighting homophobia 🌍 Promoting egalitarian relationships 🌐 Preventing sexual assault 🚬 Preventing violence 🦹‍♂️ Promoting a healthy body image 🌐 Respecting sexual diversity 🌍 Being aware of the sexualization of public space ✓ Preventing STBBIs 🏷 Preventing pregnancy

|---|---|---|---|---|
| **behaviours (e.g. masturbation, touching, kissing, embracing)**  
- Your feelings (e.g. desires and interests appearing following a previous experience)  
- Your motivations, expectations, needs and limits  
- Relationship with your partner  
  - Nature and intensity of shared feelings  
  - Comfort and trust felt with your partner  
  - Ability to respect the needs and limits of your partner  
- Anticipation of positive or negative implications  
  - Situations of sexual activity (kissing, touching)  
  - Situations involving the use of technology (e.g. sexting, sending explicit photos)  
- Self-assertion and negotiation  
- Real or perceived peer pressure, influence of pornography  
- Consent  
  - Internal motivations  
    - To express your sexual desire, feel pleasure, release sexual tension, express love, explore, satisfy curiosity  
  - External motivations  
    - To keep up with your peers in experiencing certain actions, to escape from your problems, to keep your partner, to please someone else, to impress others, to be popular, to reject parental norms, to acquire social status, to avoid conflict  
- Conditions for enjoyable sexual relations  
  - E.g. being able to express your needs and limits, to respect them and respect those of the other person (a sense of self-efficacy), facing obstacles: being able to stop sexual relations at any time if they are no longer desired (perception of control)  
  - Speaking to someone you trust: peers, parents, resource person at school  
  - Sharing activities, interests, points of view  
  - Taking care of yourself and the other person (protection against STBBIs, well-being, etc.)  
  - Each partner’s ability to be assertive and to negotiate  
  - Sexual relations considered as a measure of the depth of a relationship  
  - Ability to learn from past experiences  
  - Decisions about how to express your sexuality  
    - Being comfortable with your sexuality, whether or not you are in a couple, whether or not you are sexually active |

**WHY DO STUDENTS NEED TO LEARN THIS?**

In adolescence, initiation into active sexual life takes place progressively in an exploratory mode. Sexual behaviours with a partner for the most part occur in a romantic context. The range of sexual actions that adolescents consider acceptable increases as the partners become more involved emotionally. Those adolescents who reach pubertal maturity earliest are also, on average, the first to engage in active genital activity.

Young people who understand that the development of healthy sexuality is a learning process will have the most realistic expectations regarding their first sexual experiences and will be better able to evaluate how positive or negative experiences affect their self-image, their current relationships and their sexual identity.

<td>(14-15 years old)</td>
<td>(15-16 years old)</td>
<td>(16-17 years old)</td>
</tr>
</tbody>
</table>

**Sexual behaviours are generally sporadic** and not always planned. Adolescents:
- learn and model their sexuality on that of their friends and parents as well as the media. They are influenced by social norms that dictate what constitutes an appropriate sexual life. They are also influenced by a number of individual factors (romantic feelings, sexual desire, etc.) and also by other factors connected with the sexual act and its context.
- experiment with various actions in which they often engage in the same sequence (masturbation, kissing, touching, sexual fondling, oral-genital contact, sexual relations with penetration).
- may have sexual relations with a member of their own sex. These sexual activities are either related to an openness to and desire for sexual exploration or else related to seeking a context for discovering their own sexual orientation and later identifying as homosexual or bisexual.
- seem to have different perceptions, according to gender, of expectations regarding sexual behaviours. Girls more often speak of emotions as motives for engaging in sexual activity, while boys speak of more self-centred reasons (curiosity, sexual pleasure).

Young people between 12 and 14 years of age:
- have not generally engaged in a sexual act with penetration and have mostly experimented with kissing and touching. A Quebec study has found that 4.2% of young people at this age have had sexual relations with consensual penetration.
- have often already been exposed to explicit sexual content (at about 11 years old for boys and 13 years old for girls).

The approach taken with young people in Secondary Cycle One should:
- take into account the fact that sexual activity is an important preoccupation in the lives of adolescents, whether or not they have had actual sexual experiences.
- encourage them to reflect on their expectations, their intentions of engaging in sexual activity or not, and the context of adolescent sexual relations so that they can develop a realistic vision of future sexual experiences.

One Quebec study shows that one out of two young people have already engaged in sexual activity (oral, vaginal or anal) between the ages of 15 and 17. Other studies find that 20% to 30% of young people of that age have engaged in a sexual act with penetration. By the age of 16, 38.9% of young people say they have engaged in sexual activity with vaginal penetration. This number rises to 68% among 18- and 19-year-olds.

**Between the ages of 14 and 17, adolescents’ exploration of sexual activity develops considerably.**
- Adolescents move from auto-erotic sexuality to sexual experience with a partner, but continue to experiment with masturbation more often than with other acts with a partner.
- Sexual relations with penetration increase in frequency among boys between 14 and 15, and among girls between 15 and 16.
- A minority of adolescents may have sexual relations without emotional involvement. New socio-sexual phenomena such as friends with benefits have emerged (a friend to have sex with without being in a romantic relationship). This type of sexual interaction is considered positive for some, but it can be a problem for others who have vain hopes that a romantic relationship will result from it, or who consider the relationship to be romantic even though the feeling is not mutual.

The approach taken with young people in Secondary Cycle Two should:
- consider sexual relationships from a positive perspective and present their useful contribution to adolescent development as well as their challenges.
- place value on respecting the needs of two people involved in sexual behaviours, especially by helping adolescents appreciate the connections between behavioural choices and their implications.
- use strategies that enable adolescents to make enlightened choices concerning sexual behaviours. These strategies must take into account the particular contexts of adolescent sexual relations (desire and intense sexual arousal, limited time, peer and social pressure, new socio-sexual realities, etc.).
### SEXUAL VIOLENCE

<table>
<thead>
<tr>
<th>LEARNING CONTENT</th>
</tr>
</thead>
</table>
| **1)** Reflect on the impact of myths and prejudices about sexual assault  
- Myths and prejudices  
  - About the victim  
  - About the aggressor

Why do students need to learn this?

Certain factors related to the psychosexual development of young people make adolescents vulnerable to sexual violence, including:

- curiosity about sexuality, desire for love, closeness, romance and romantic relationships, desire for acceptance, feeling of independence. All these can cause some young people to ignore safety rules, especially in the presence of their friends in the real or virtual world.

Among 12 to 17 year olds:

- 57% of sexual assaults are perpetrated by an acquaintance, a friend or an ex-partner. The age of the presumed perpetrators indicates that many of them are peers since 39% were between 12 and 17 years old. 
- The Internet is an integral part of their social life: they spend a lot of time on social media where they are supervised less than they were in their childhood. Although this is not the most frequent form of sexual assault in early adolescence, young people 12 to 17 years old are overrepresented among victims of online luring (82%, of which 46% are between the ages of 12 and 14 and 36% are between the ages of 15 and 17).

At this age, prevention of sexual assault consists in:

- repeating prevention messages, reinforcing the development of self-protection skills begun in elementary school and examining the notion of consent and the nuances associated with it so as to be able to protect themselves in risk situations common in adolescence.
- reducing the number of new cases of sexual violence by targeting young people with problematic behaviours as well as potential victims.

Young people between the ages of 15 and 17 represent 15% of all young victims of sexual assault under 18 years of age in Québec. Among girls, 6.4% of 13 year olds and 10.9% of 16 year olds have experienced at least one episode of sexual violence committed by their romantic partner.

As well as continuing to be vulnerable to sexual assault, young people are at risk of experiencing violence in their dating relationships. (See the learning content for Secondary IV on the topic of emotional and romantic life.)

### Adolescence: An Important Period of Transition for Learning and/or Maintaining Safe Sexual Behaviors

Adolescence is an important period of transition for learning and/or maintaining safe sexual behaviours. Several factors increase the vulnerability of young people to STBBIs and pregnancy:

- Self-discovery, the search for identity and sexual orientation, and learning about sexuality (planning to have sexual relations, negotiating condom use, self-assertion in romantic and sexual relationships), feelings of invulnerability, magical thinking, a desire to take risks, thrill-seeking, bravado, the need to reassure themselves about their sexual maturity.
- Starting to be sexually active at a younger age (longer exposure to risk).
- LGBT young people being victims of heterosexism and homophobia, which can affect self-esteem and the ability to be self-assertive.

### Why Do Students Need to Learn This?

The great majority of 13 and 14 year olds are not sexually active. They have mainly experimented with kissing and touching. A Québec study estimates that 4.2% of young people at this age have had consensual sexual relations with penetration.

Sexually active 16 year olds have reported having had their first sexual relations at the age of 14.5. The sexual behaviours of young people (e.g., infected or infertile or that the pill protects against STBBIs) • Personal options for safe behaviours • Protection methods adapted to your needs • Context and planning of sexual relations • Ability to assert yourself and negotiate the use of a condom • Strategic place and time for prevention counselling (emergency oral contraception, testing for and treatment of STBBIs, vaccination)

A Québec study shows that one young person out of two has had sexual relations (oral, vaginal or anal) between 15 and 17 years of age. Another study suggests that 30% of young people of this age have had sexual relations with penetration. By the age of 16, 38.9% of young people claim to have had sexual relations with vaginal penetration. This number increases to 69% among 18 and 19 year olds.

Adolescents between the ages of 15 and 19 years form one of the groups most at risk of contracting an STBBI. Cases of chlamydia among girls between the ages of 15 and 19 have risen more than 250% since 2006.

- age of first sexual relations, number of partners, use of contraception) appear to have changed little in recent decades. However, early initiation into active sexual behaviour increases the vulnerability of young people to risky sexual behaviours by extending the period in which young people have sexual contact and consequently increasing the number of sexual partners.

The approach taken to encourage students to take steps to prevent STBBIs and pregnancies in Secondary Cycle One should:

- consider age, level of development and sexual experience of the students.
- be offered prior to the start of sexual activity because safe behaviours applied in first sexual relations have a greater chance of being maintained over time.
- ensure that both boys and girls understand that they can play an active role in prevention.
- consider the protection factors and risk factors that influence the sexual behaviours of adolescents (environmental and individual) as well as other key health factors (knowledge, perception of risk and seriousness, personal attitudes and values, perception of norms and behaviours of peers) with the aim of developing attitudes favourable to safe practices.

59% of sexually active young people used condoms each time they had sexual relations, while 10% have never used them. The use of condoms tends to diminish over time in adolescence, mainly owing to the use of oral contraceptives or to having a regular partner.

Sexual behaviours in adolescence are characterized by their sporadic and unplanned nature, which can have a negative effect on the adoption of safe practices. Many young people who have not yet had sexual relations say that they are firmly in control regarding the use of contraception and communication with their partner. This perception of control diminishes when young people become sexually active and are confronted with the difficulties of maintaining a relationship, and communicating and negotiating with a partner.

The approach to the prevention of STBBIs and pregnancies offered in Secondary Cycle Two must continue to increase students’ awareness and responsibility and:

- reinforce individual values that promote safe sexual behaviours and skills in managing sexuality, sexual risks and practices.
- emphasize the use of condoms and contraceptive measures in order to enable young people to reduce the possibility of pregnancy or STBBIs.
- encourage the adoption and maintenance of safe sexual behaviours by reinforcing young people’s sense of self-efficacy in asserting themselves and negotiating condom use.
- develop the motivations and skills required to judge the risks involved in different situations.

| **SECONDARY I**  
| (12-13 years old) |
| **SECONDARY II**  
| (13-14 years old) |
| **SECONDARY III**  
| (14-15 years old) |
| **SECONDARY IV**  
| (15-16 years old) |
| **SECONDARY V**  
| (16-17 years old) |
| **GENERAL UNDERSTANDING OF SEXUALITY** |

**LEARNING CONTENT**

1) Become aware that during adolescence, you will gradually adopt new roles and behaviours related to your sexuality and increasingly make your own decisions
- Sexuality and its dimensions
  - Biological, psychoaffective, socio-cultural, interpersonal, moral
- Construction of a vision and personal choices
  - Wishes, needs, limits and the ability to consider those of others
  - Following or not following various sexual stereotypes and social norms
  - Strategies for finding information, help, etc.

**WHY DO STUDENTS NEED TO LEARN THIS?**

Secondary school students:
- Experience numerous changes in the area of sexuality: they consolidate their sexual identity, become aware of their sexual orientation, engage in emotional and romantic relationships, progressively experiment with sexual behaviours and develop their capacity for emotional and sexual intimacy. These experiences are sources of learning, but they can also induce students to question themselves when they are exposed to different sources of contradictory information.

The approach taken with secondary school students should:
- Be consistent with that taken at the elementary level, where the development of a general and positive vision of sexuality was begun, emphasize the positive role that sexuality plays in our lives and not focus only on the “risks” associated with it or the preventive aspect.
- Help young people face the challenges posed by their sexuality.

1) Become aware of different facets of yourself that will help you to be comfortable with your sexuality all your life (sexual subjectivity):
- Be able to obtain sexual pleasure alone and with a partner
- Be able to make decisions, assert yourself, articulate your needs and wishes
- Be able to introspectively examine your expression of your sexuality, including your sexual behaviours
- Have a positive body image from a sexual point of view (consider yourself attractive)
